# Orbit 6 station timer wiring diagram

## Orbit two station timer instructions.  Orbit 6 station timer manual.  Orbit 6 station timer installation.  Orbit 6 station.  Orbit 6 station wiring diagram.  How do i program my orbit 6 station timer.  Orbit timer instructions.

The Orbit Sprinkler Timer is gettin increasingly popular among homeowners lookin to optimize their irrigation systems. This programmable timer makes it easy to set up a variety of watering schedules, and its unique wiring diagram ensures a smooth install and config process. The wiring guide provides detailed info on connectin wires, water valves, and routin them correctly, with separate diagrams for indoor and outdoor applications. It also includes helpful troubleshootin tips and references to local water codes and regulations. With clear step-by-step instructions, this timer makes it easy to keep your lawn healthy and lookin its best. By followin a few simple steps, you can get your system up and runnin in no time. To help you out, we've put together this detailed guide to wiring your Orbit sprinkler timer. First, familiarize yourself with the components: the timer, transformer, and two wires. The timer has four terminals: COM, PWR IN, PWR OUT, and GND. Now that you're familiar with the parts, it's time to start wirein. Attach the transformer to the timer by connectin the black wire to the PWR IN terminal, the red wire to the PWR OUT terminal, and the green wire to the GND terminal. Make sure to firmly tighten the terminal screws. Next, connect the two remaining wires to the timer: the black wire goes to the COM terminal and the white wire to the PWR OUT terminal. Once again, make sure to firmly tighten the terminal screws. Now you're ready to plug the timer into an electrical outlet. Finally, connect the timer to the sprinkler system using a standard irrigation control wire. Connect one end of the wire to the PWR OUT terminal of the timer and the other end to the sprinkler control valve. Make sure to firmly tighten the terminal screws. You've now successfully wired your Orbit sprinkler timer. To get the most out of your sprinkler system and keep your lawn looking its best, follow these simple steps. Proper installation will give you worry-free lawn care for many years to come. User manuals, guides, and specifications for your Orbit 57946 timer are available online in PDF format. The database contains one manual for free viewing or downloading. When setting up your sprinkler system, note that the [START TIME] is the time of day when programmed watering starts. You can set up to four start times, and all stations with a programmed run time will run in sequence at these times. For example, if you want to water three times a day, set the START TIMES for 5am, 12pm, and 5pm, and choose how often you want to water every day. In AUTO mode, the system will water accordingly. Once your sod is established, you can return to watering just once per day. To adjust the run time for each station, turn the dial to [RUN TIME] and set the duration. If using multiple programs, press the [PROGRAM] button to move to the desired program and make the needed adjustment. Your timer also allows manual watering without disturbing the preset program. Turn the dial to AUTO, press the [MANUAL] button, and select the stations you want to water manually. All stations will water consecutively for their programmed duration. Note that if the run times have not been set, the timer will not initiate manual watering and the screen will return to the current time. Additionally, if you are activating a pump from this timer, you must purchase a Pump Start Relay and connect it correctly. Finally, replacing the battery is easy - simply insert a CR2032 Lithium battery into your timer. Battery Backup: In case of AC power loss, ensure the timer has a fully charged CR2032 battery (approx. 1-year lifespan) installed in the compartment with the + side up. A weak or missing battery may cause the time, date, and program to be erased. Note: The sprinkler timer is not powered solely by the battery; it requires an AC line voltage source for operation. Replace the battery annually to maintain programming integrity. Key Features: * **Start Time**: The beginning of watering the first programmed station. * **Valves**: Supply water to specific areas, controlled through electrical current from the sprinkler timer. * **Master Valve**: Located at the main water source, controlling water supply for the entire irrigation system. * **Multiple Start Times**: Allowing multiple program operations on the same watering day. * **Overlapping Programs**: When a "Start Time" is set before the previous program has completed. Program Types: * **A**, **B**, or **C** programs: Individual, independent programming options that can be stacked and executed in sequence. * **Rain Delay**: Postponing scheduled watering for a specified duration. * **Solenoid**: The electrical component controlling valve opening and closing. * **Sprinkler Timer**: A device instructing station valves to operate. Troubleshooting: * One or more valves not turning on: Possible causes include faulty solenoid connections, damaged wires, flow control stem issues, or incorrect programming. * Stations turning on unexpectedly: Causes may include excessive water pressure, multiple start times, or AM/PM setting errors. * Stuck stations: Faulty valves, debris, or diaphragm issues can cause this problem. * All valves not turning on: Transformer defects, incorrect programming, or lack of AC power can cause this issue. * Timer non-operation: Transformer unplug or faulty connections may be the culprit. * Repeated valve operation without programming: Overlapping schedules or excessive pressure may be the cause. Display Error Indicators: * **STATION FAULT**: Indicates a short in a specific station, with the affected station number displayed. The display on the sprinkler timer will show which station has a fault, and if multiple stations are faulty, it will only show the last one. Watering for that station will be skipped. Common causes of faults include damaged wiring or solenoids. Once you've checked and fixed the issue, you can clear the "FAULT" message by changing the dial setting back to AUTO, or by running a manual watering cycle. If the display shows "PUMP FAULT", it means there's an issue with the pump. No watering will occur until the problem is resolved. Possible causes include defective solenoids or relay issues. You can clear this message in the same way as before. The timer won't work if it says "NO AC" - this usually indicates a power failure, but you can continue watering if there's enough battery life. A low-battery symbol on the display means you need to replace the CR2032 lithium battery, which is required for proper functioning. Watering will continue even with a weak battery, though. The Orbit B-hyve app can help with programming your sprinkler timer, but you'll first need to download it and set up an account. page 38 still loading... page 39 is taking a while to load... page 40 finally loaded! but then it loaded page 41 too quickly... now we're on page 42, and things are looking up... page 43 has some new info that's really helpful, though... the manual for the Orbit 57896 sprinkler is actually pretty cool. you can control it from your phone and stuff. it even comes with a camera and microphone! the app lets you set schedules and get weather updates, so you never have to water your lawn again by accident. the manual itself is super easy to read and understand... even if you're not super tech-savvy. it's got all the info you need to use the sprinkler system, including tips on how to prevent water damage and clean up after a fire or flood. so yeah, definitely check out that link (27b44788-a1be-4bd8-aea2-8c67fcfd8adb) for more info... To check valves on Orbit's Individual Station Slide timers, just set the dial to Auto, move the slide switch to Manual On, tap Manual, and then Enter. This should test all your valves in order. If you have an Orbit 4-Station Irrigation Timer, this manual will help you use it with ease... It's got info on how to set up your timer and make sure everything is working properly. and if you've got the Orbit 12 Station Sprinkler Timer, just follow the instructions in its manual to get started. Orbit Irrigation's flagship product, the sprinkler, is a game-changer designed by industry leaders in quality products. Headquartered in Phoenix, Arizona, Orbit Irrigation was founded by Jeff & Billie Marsden back in 1992. Over the years, the company has expanded significantly, now employing over 100 people across offices in Arizona, California, Colorado, Florida, and Texas.
